Executive Summary: Central Tendency Analysis

An analysis of central tendency metrics (**Mean, Median, and Mode**) was conducted on a placement dataset of 108 students to evaluate academic trajectories alongside subsequent compensation offerings.

Academic Performance Trends (Mean Analysis)

- **Secondary School (SSC):** Students achieved the highest core academic foundation with a **Mean score of 67.30%**.
- **Higher Secondary (HSC) & Undergrad (Degree):** Academic performance experienced a minor marginal dip during mid-tier education, dropping slightly to a **Mean of 66.33% and 66.37%** respectively.
- **Employability Test (ETest):** Performance rebounded significantly, reaching a peak **Mean score of 72.10%**, indicating strong technical or aptitude preparation.
- **Post-Graduation (MBA):** Final academic metrics normalized back down to a **Mean of 62.28%**.

Compensation Insights & Distribution Behaviour

- **Mean Salary (₹288,655):** The average salary sits at approximately **₹2.89 Lakhs per annum (LPA)**. However, because the arithmetic mean is highly sensitive to extreme values (high-earning outliers), it skews higher than what a typical student receives.
- **Median Salary (₹265,000):** The median salary stands at **₹2.65 LPA**. Since the median represents the true middle data point of the distribution, it serves as a more reliable indicator of the "typical" salary offered to a

student with baseline average academic credentials across SSC, HSC, Degree, ETest, and MBA milestones.

- **Mode Salary (₹300,000):** The most frequently occurring salary package across the dataset is **₹3.00 LPA**, indicating a strong cluster of recruitment offers concentrated at this specific milestone.

Conclusion

While academic performance fluctuates predictably between secondary and higher education milestones, the data demonstrates that the **median distribution provides the most realistic compensation baseline** for standard candidates, whereas the **mode highlights the most common target package** offered by employers.
