Percentile analysis:

	sl_no	ssc_p	hsc_p	degree_p	etest_p	mba_p	salary
Mean	108	67.3034	66.3332	66.3702	72.1006	62.2782	288655
Median	108	67	65	66	71	62	265000
Mode	1	62	63	65	60	56.7	300000
Q1:25%	54.5	60.6	60.9	61	60	57.945	240000
Q2:50%	108	67	65	66	71	62	265000
Q3:75%	161.5	75.7	73	72	83.5	66.255	300000
99%	212.86	87	91.86	83.86	97	76.1142	NaN
Q4:100%	215	89.4	97.7	91	98	77.89	940000

- **Spread (IQR = Q3 − Q1):** etest_p is the widest at 23.5 points (60 to 83.5), then ssc_p at 15.1, hsc_p at 12.1 and degree_p at 11.0. mba_p is the tightest at 8.3 (57.9 to 66.3) and almost perfectly symmetric around its median.
- **Upper tail:** hsc_p (P99 91.86, max 97.7) and degree_p (P99 83.86, max 91) have a few standout scorers well above the rest. etest_p's top scores are tightly packed (P99 97, max 98), and nobody tops 77.89 in the MBA.
- **Salary:** the middle 50% earn 240,000–300,000 (IQR 60,000), yet the maximum is 940,000. That is more than 3× the 75th percentile and well beyond the outlier fence of 390,000 (Q3 + 1.5 × IQR). This long right tail is what inflates the mean. 300,000 is both the mode and the 75th percentile, so it is a very common offer.
- **Data note:** the salary 99th percentile shows NaN, most likely because the column has missing values (probably students without an offer) that the percentile function didn't skip. df['salary'].quantile(0.99) or np.nanpercentile will fix it. It also means the salary figures describe only rows that have a salary.

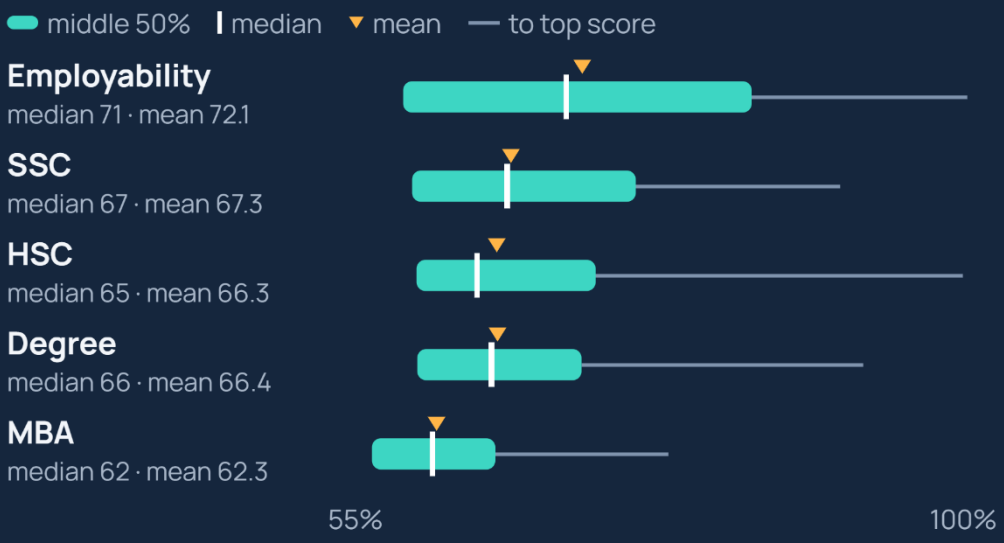

Takeaway: Academic scores are consistent across students, the employability test separates them the most, and salary should be reported with its median because a few high offers inflate the average.

DATA SNAPSHOT · 215 STUDENT RECORDS

Scores are steady. Salary is skewed.

Central tendency & percentile analysis

Where the middle 50% of scores sit

Salary: the middle 50% earn 240,000–300,000

High-end offers pull the mean ~9% above the median.

Salary figures cover students with a recorded salary.
